Formula Workshop

In Panorama, formulas are *really* important.
The Formula Workshop lets you quickly test formulas and perform calculations.
It is much improved over the Panorama 6 version.

Instant Calculations

Results are calculated immediately, as you type. No need to press Enter.

DEMO

Multiple Windows

Click to open a second workshop window.

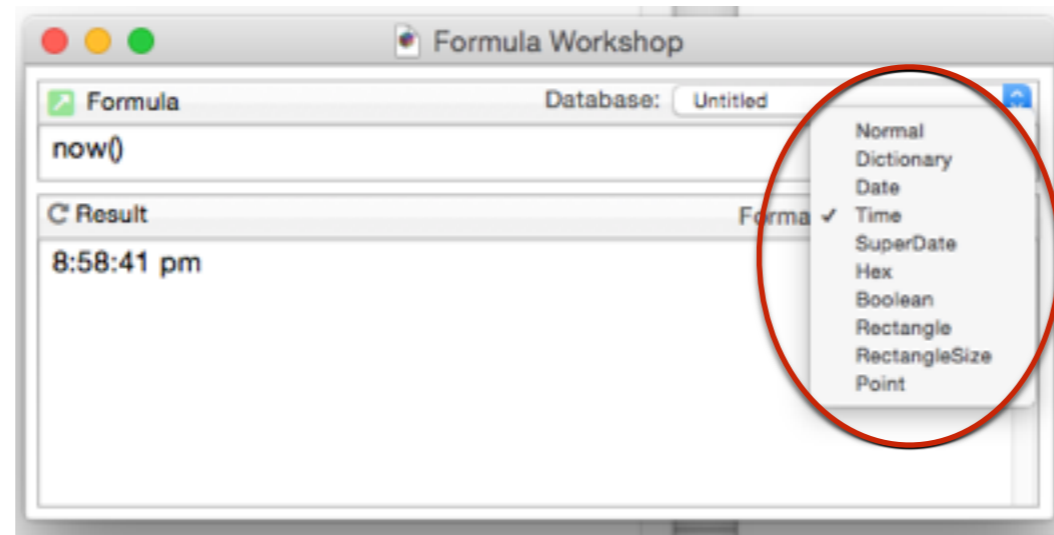

You can open as many workshop windows as you like.

they are all independent of each other

btw, these are implemented using Panorama's "clone window" feature

DEMO

Display Format

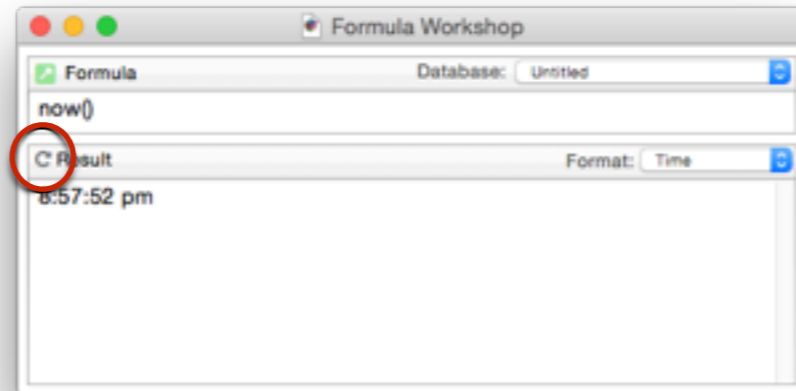

The workshop can automatically format the data for you.

Normal is for numbers and text.

DEMO

Refresh

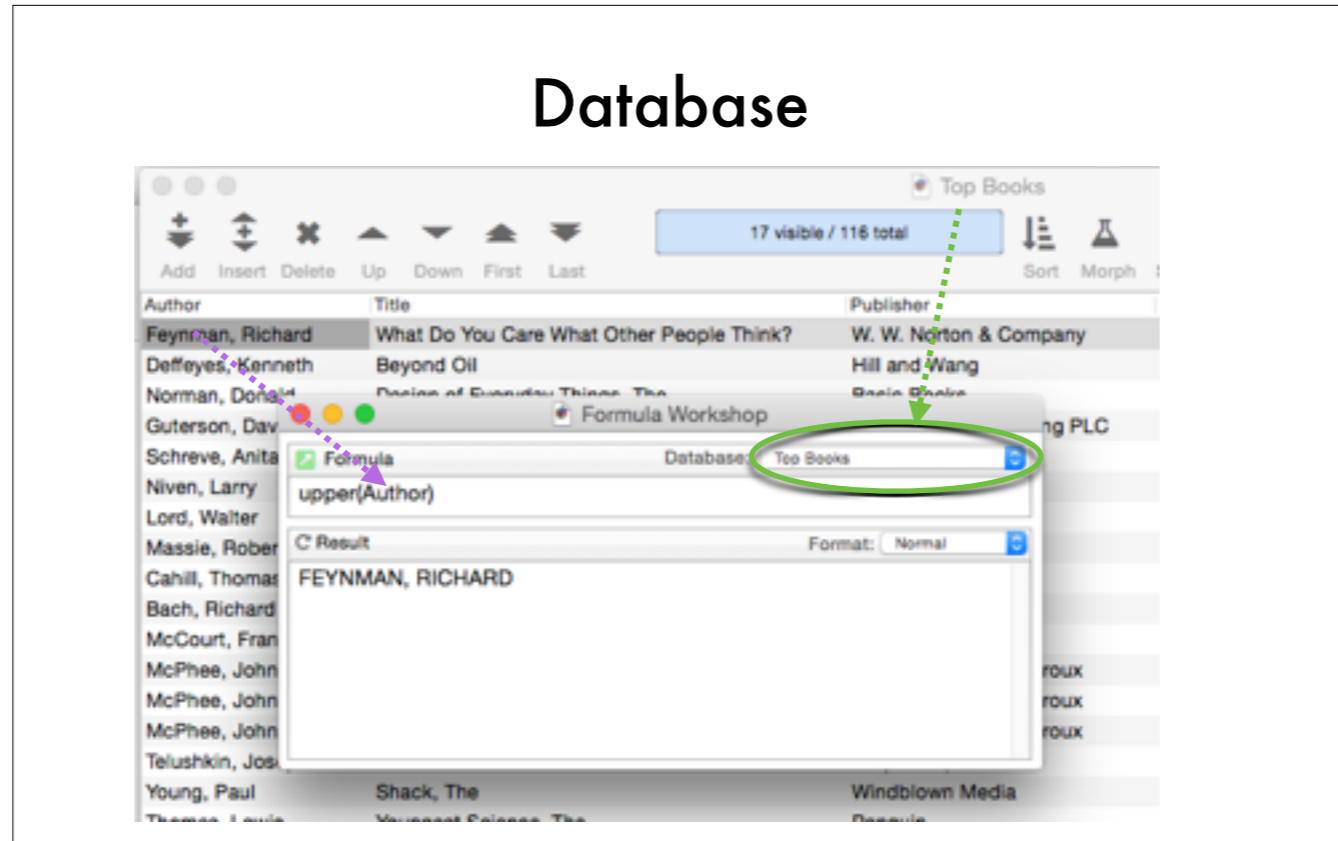

If you need the calculation to refresh without typing, press *Result* or the refresh arrow (circular arrow).

Use this for formulas that might change over time, like `now()`, `info("files")`, `rnd()`, etc)

DEMO

Database

If you link the workshop to a database, you can use fields and fileglobal variables in the formula

Note: You cannot use local or windowglobal variables in the workshop
